-i- FUNCTION: ACTS AS THE TARGET FOR THE CELL-CYCLE ARREST AND IMMUNOSUPPRESSIVE EFFECTS OF THE FKBP12-RAPAMYCIN COMPLEX.

-i- SIMILARITY: BELONGS TO THE PI3/PI4-KINASES FAMILY.

-i- SIMILARITY: CONTAINS 8 HEAT REPEATS.

                                                                                                                                                                                                                              IDENTIFICATION OF FN-III REPEATS.
                                                                                                                                                                                                                                                                           Biochem. Biophys. Res. Commun.
FUNCTION: RECEPTOR FOR AN EXTRACELLULAR SIGNAL REQUIRED TO INSTRUCT A CELL TO DIFFERENTIATE INTO A R7 PHOTORECEPTOR. THE LIGAND FOR SEV IS THE BOSS (BRIDE OF SEVENLESS) PROTEIN ON THE SURFACE OF THE NEIGHBORING R8 CELL.

CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein tyrosine phosphate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Dev. 2:620-634(1988).

Natl. Acad. Sci. U.S.A. 87:5351-5353(1990).

FUNCTION: RECEPTOR FOR AN EXTRACELLULAR SIGNAL REQUIRED TO INSTRUCT A CELL TO DIFFERENTIATE INTO A R7 PHOTORECEPTOR. THE LIGAND FOR SEV IS THE BOSS (BRIDE OF SEVENLESS) PROTEIN.

CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein
                                                                                                                                                                                                                                                                                   tyrosine phosphate.
SIMILARITY: BELONGS TO THE TYR FAMILY OF PROTEIN KINASES. INSULIN
                                                                                                                                                                                                                        NATIVE PROTEIN OR SERVES AS A CLEAVED SIGNAL SEQUENCE.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     NATURE 402:761-768(1999).

NATURE 402:761-768(1999).

- FUNCTION: SIGNAL-RECOGNITION-PARTICLE ASSEMBLY HAS A CRUCIAL ROLE FUNCTION: SIGNAL-RECOGNITION THE ROUGH ENDOPLASMIC RETICULUM MEMBRANE. SRP9 TOGETHER WITH SRP14 AND THE ALU PORTION OF THE SRP RNA, CONSTITUTES THE ELONGATION ARREST DOMAIN OF SRP. THE COMPLEX OF SRP9 AND SRP14 IS REQUIRED FOR SRP RNA BINDING (BY SIMILARITY).

- SUBUNIT: SIGNAL RECOGNITION PARTICLE CONSISTS OF A 78 RNA MOLECULE OF 300 NUCLEOTIDES AND SIX PROTEIN SUBUNITS: SRP72, SRP68, SRP54, SRP19, SRP14 AND SRP9 (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MEDLINE=20083487; PubMed=10617197;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Genome Res. 12:689-700(2002).

- PUNCTION: Transfers the 4'-phosphopantetheine molety from coenzyme A to a Ser of acyl-carrier protein (By similarity).

- CATALYTIC ACTIVITY: CoA + apo-(acyl-carrier protein) = adenosine 3',5'-bisphosphate + holo-(acyl-carrier protein).

- COPACTOR: Magnesium (By similarity).

- SUBCELLULAR LOCATION: Cyroplasmic (By similarity).

- SUBCELLULAR LOCATION: TRANSFERASE SUPERFAMILY. ACPS
